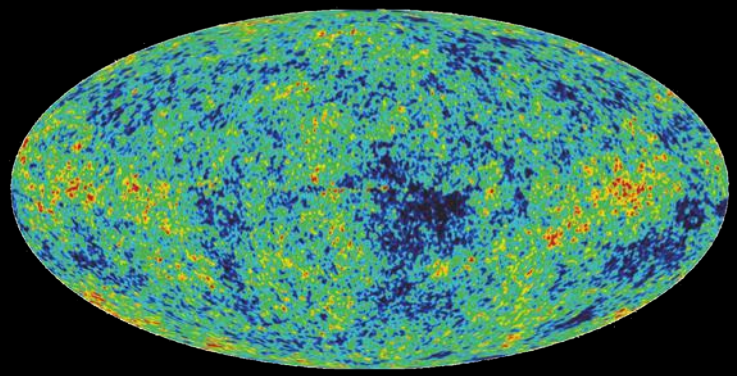
The Big Bang Theory



The Big Bang

- if ***universe*** is *expanding*, *must* have been *smaller*
- '*rewind*' ~ *14 billion years* & ***universe*** would be *a tiny, very hot & very dense* ***point***
- we call this moment ***The Big Bang***
- coined ***derisively*** by *Fred Hoyle* (1950)
- alternatives (like ***Static Universe Model***) are ***unable*** *to* ***explain*** *observations, predict like* ***BBT***

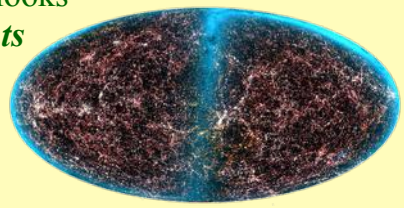
Expansion of the Universe

- universe ***not*** expanding into ***pre-existing space***
- universe ***itself*** *is growing*, ***creating spacetime***

(eg) *Where is north of the North Pole?*

- ***Cosmological Principle:***

(observable) universe looks the ***same*** from ***all points***



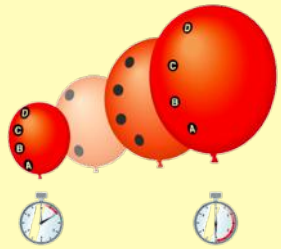
- ***no*** preferred *vantage*
- ***no center, no edge***

Q: *Evidence for this?*

- ***uniform*** distribution of galaxies on large scale

- *every* galaxy sees (all) others *moving away*

DEMO: *inflating a balloon*



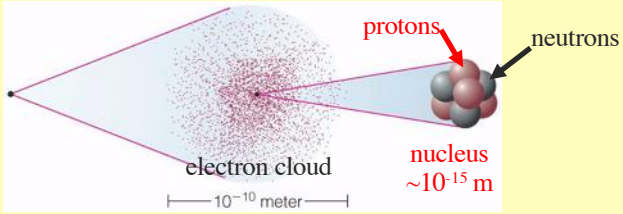
DEMO: *galaxy expansion with volunteers*

- ***expansion of space*** occurs ***away from*** regions with ***strong gravitation*** (*galaxy clusters, etc.*)

Particles & Matter

• matter is made of *tiny particles* called ***atoms***

(eg) *take a ruler and start with 1mm (10^{-3}m)…*



• ***protons & neutrons*** in the (dense) *nucleus*
• ***electrons*** in a "cloud" surrounding *nucleus*

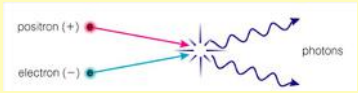
• ***protons & neutrons*** made up of ***quarks***…

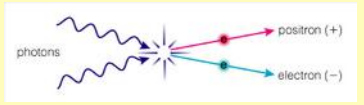
Matter & Energy

• ***photons*** are the ***particle*** form of ***light***
• contain *varying amounts* of ***energy***

(eg) ***shorter*** wavelength (***ie***. blue), ***greater*** energy

• ***E = mc²*** states *energy & matter* ***interchangeable***





• ***antimatter*** *similar* to matter but with ***opposite*** properties ***eg***. *charge;* ***annihilates*** matter!

Forces of Nature

• **today**, our universe has ***4 known, separate forces: Gravitational, Electromagnetic, Strong, Weak***

• ***Gravitation*** (***Newton***, 1687)

• ***electric force*** (***Coulomb***, 1785)

• ***electromagnetic force*** (***Oersted***, 1820)

• ***nuclear*** *forces* discovered "*recently*" (1930's)

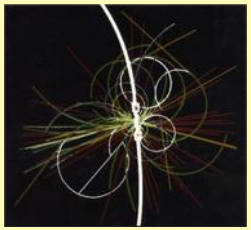
• ***everything*** we see results from these 4 forces
(eg) *Why can't you walk through walls?*

Unifying the Forces

• ***electromagnetic*** (***Maxwell***, 1864)

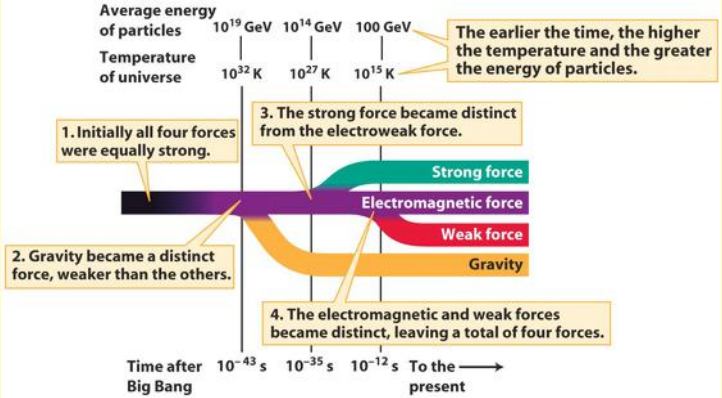
• ***electroweak*** (***CERN***, 1983)

• ***Grand Unified Theories*** (***GUTs***): ***strong+electroweak***



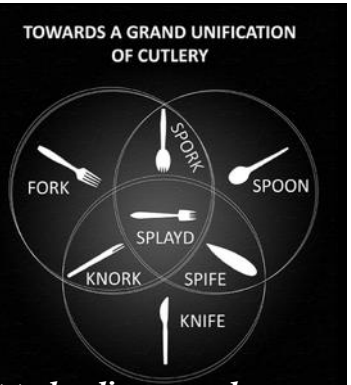
• ***Theories of Everything*** (***TOEs*** or ***Quantum Gravity***) unify ***all*** 4 forces (***GUT + gravity***)

• in early, very ***hot*** universe, ***all*** *forces were unified*



*(**eg**) ice, water, and water vapour appear **very** different but are all aspects of the **same** substance (water vapour) when cooled down enough!*

***CLICKER**: The 4 fundamental forces are **not** currently **unified** because…?*



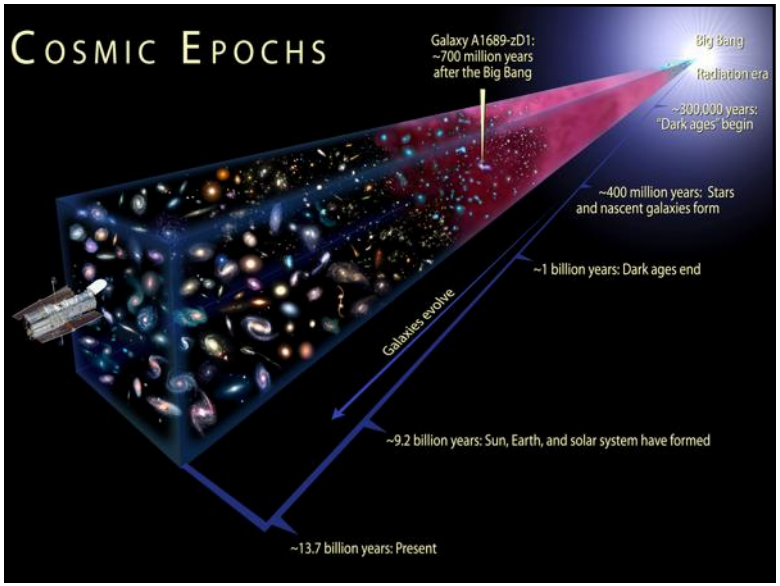
(a) there are other forces yet to be discovered
(b) all of the anti-matter is missing
(c) temperatures are too low
(d) gravity does not operate at the atomic level

The History of the Universe

- *theoretical physics*, *observation* & *experiment* yield a ***timeline*** for the *evolution of universe*

- can ***directly*** test behaviour of matter & energy at temperatures ***~10^{15} K*** or ***~10^{-12} s*** after ***Big Bang***

- ***physics*** can make ***predictions*** back to ***~10^{-43} s*** after ***Big Bang*** (***"Planck Time"***) ***but no further***



Planck Era
(*before* 10^{-43} *s*)

- *least* well understood; ***beyond*** *our current physics*
- ***Why?*** *quantum fluctuations* (***energy***) would cause extreme *changes in time & space* (***mass***)
- *mass fluctuations* lead to *gravitational variations*
- but… *quantum* & *relativity* do ***not*** "get along"
- ***gravity*** **separates** from other forces ***by end of era***

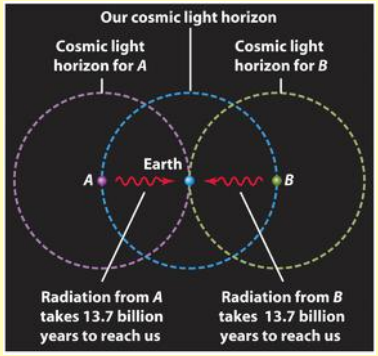
GUT & Inflation
(~ 10^{-35} *s*)

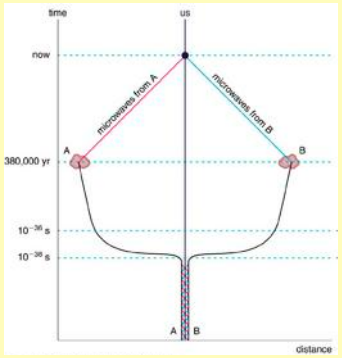
- 2 forces: ***gravity*** & ***GUT force***
- universe cools; ***Strong Force*** *separates from* ***GUT***
- released energy caused (?) a ***very*** rapid expansion

Q: *What happens if you heat a gas quickly?*

- universe *expanded from* ***size of an atom*** *to* ***size of the solar system*** in *under* 10^{-32} *s*

- *widely separated* regions *today* **were** *very close*
- explains ***why*** universe appears so *uniform*





- ***Alan Guth*** (1981) proposed *separation of strong force* from ***GUT force*** caused ***inflation***

ElectroWeak Era
(*up to* 10^{-12} *s*)

- *modern physics* & *particle accelerators* provide ***direct*** *evidence* of conditions at **end** of this era
- temperatures a *billion times hotter than Sun's core*
- *energy & matter* still *converting back & forth*
- by *end* of era, *all 4 forces were* ***separate***

Particle Era

(*up to 10^{-3} s*)

• *temperatures too low* for spontaneous "*creation*" *of matter/antimatter*

• so… **matter & antimatter** *annihilated*
• left with *slight* excess of *matter*

(eg) matter:antimatter excess ~ 1 part in a billion

• ***quarks*** formed ***protons*** & ***neutrons***
• ***electrons***, ***neutrinos***, etc. also appear

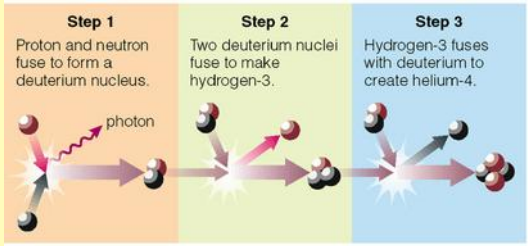
(eg) BB to end of ***Particle Era*** quicker than *blink of an eye*

Era of Nucleosynthesis

(*up to ~5 min*)

• left over ***protons*** & ***neutrons*** merged into *heavier nuclei* (***fusion***)

• universe expands; ***temperature & density*** drop: ***fusion*** *stops*



• left with *75% protons* (***H***) & *25% helium* (***He***) (by mass) & a little *deuterium* & *lithium*

Recombination

(*~380,000 years*)

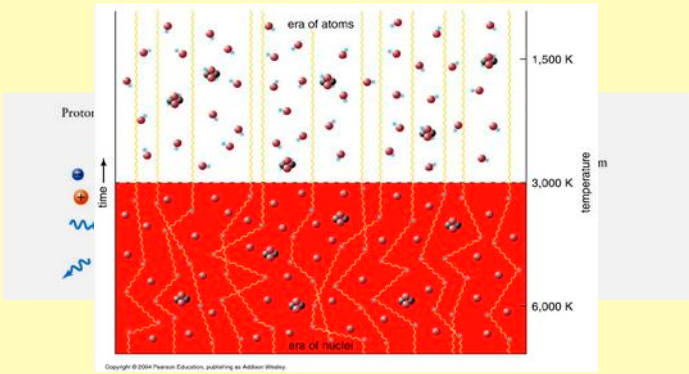
• by *end of* ***nucleosynthesis***, universe consists mostly of ***H*** & ***He*** *nuclei*, free ***electrons*** & ***photons***

• ***photons*** collided with ***electrons***

• *neutral atoms* ***ionized*** by "hot" ***photons until*** temp falls below ~3000 C: ***recombination***

• ***energy*** & ***matter*** decoupled; ***photons*** move ***freely***

• source of ***Cosmic Microwave Background***



• ***visible light photons*** emitted back then have been *stretched to microwaves* by expansion of universe

(eg) tune a TV "between" stations; about **1% of the "snow" you see** is result of ***CMB*** photons!

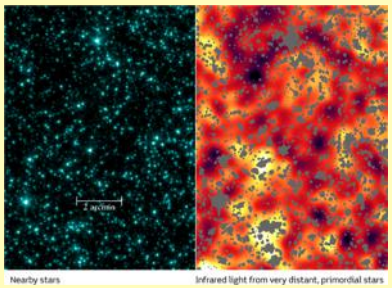
Dark Ages & First Stars

(~400 million years)

- after ***recombination***, left with *cooling atoms*
- *no other major source of photons* - "dark"

- gravity concentrated mass into massive "***Population III***" stars

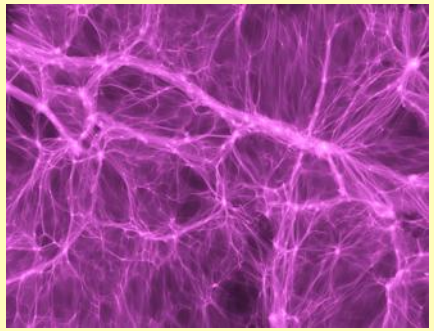
- 100's x Sun's mass???
- made **only** of ***H***, ***He***



Formation of Galaxies

(~1 billion years)

- *material/stars aggregated* into clumps, forming first ***galaxies***



- ***galaxy*** *distribution* suggests there is "*more than meets the eye*"

Evidence for Big Bang

- why is ***Big Bang Theory*** a ***theory***?

1) ***Cosmic Microwave Background*** radiation

2) ***nucleosynthesis***, ***(eg) helium abundance***

3) explains observed ***expansion*** (***red-shift***)

4) explains ***darkness of the night sky***

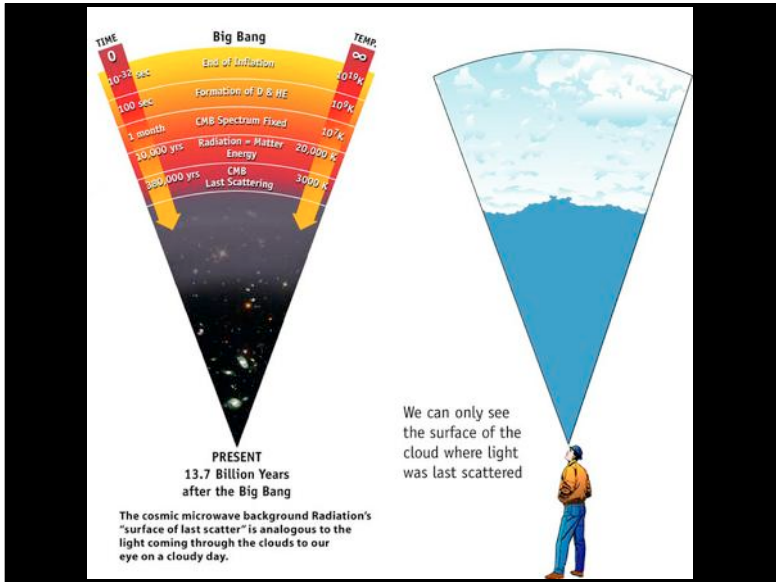
5) explains ***varying appearance of old galaxies***

Cosmic Microwave Background

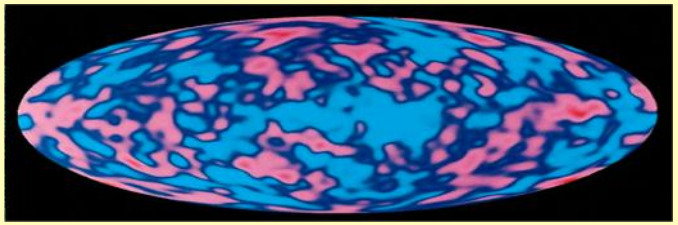
Q: What *is* the Cosmic Microwave Background?

- ***radiation*** from universe when *~400,000 years old*
- temperature then ***~ 3000 K***

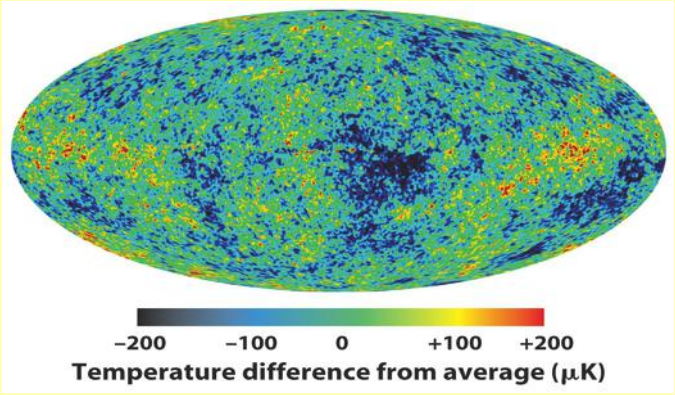
- expansion *red-shifted* the *radiation* to ***microwaves***
- current temperature predicted to be ***~ 3 K***



- MW "noise" discovered (Penzias & Wilson 1965)

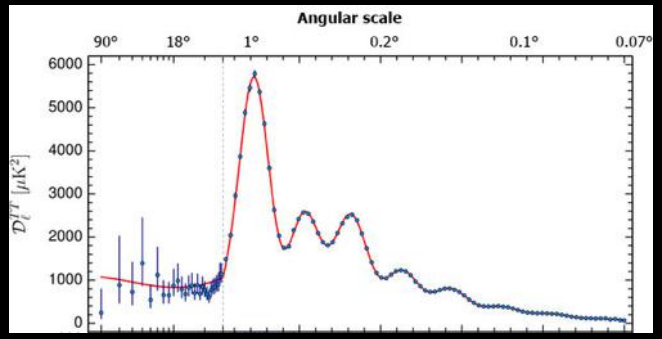


- characteristics *precisely* match predictions of ***BB***
- ***COBE (COsmic Background Explorer):*** 1990's
- ***COBE*** saw ***very*** *uniform temperature field*
- *space* has temperature of *2.7 °K*
- varies less than *1/10,000 K in all directions*

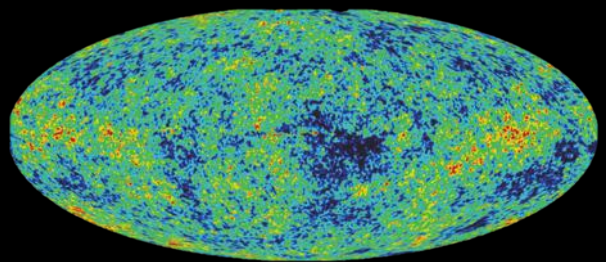


- ***WMAP (Wilkinson Microwave Anisotropy Probe):*** 2003 confirmed these fluctuations, indicating density perturbations that would *eventually* form galaxies

Planck results



CLICKER: The very slight fluctuations seen in the CMB are…?



(a) precursors of galaxies & galaxy clusters

(b) measurement uncertainties

(c) variations due to dust in the Milky Way

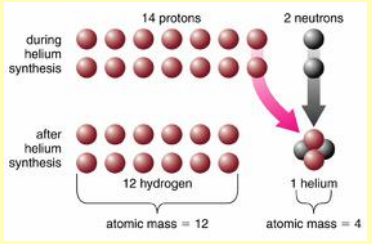
(d) the signature of matter-antimatter reactions

Nucleosynthesis

• ***Big Bang Theory*** predicts temperature & density of early universe ⇒ amount & type(s) of ***fusion***

• see ***He*** "everywhere" in ***observable universe***

• BUT… *stars can only account for ~10% of He*

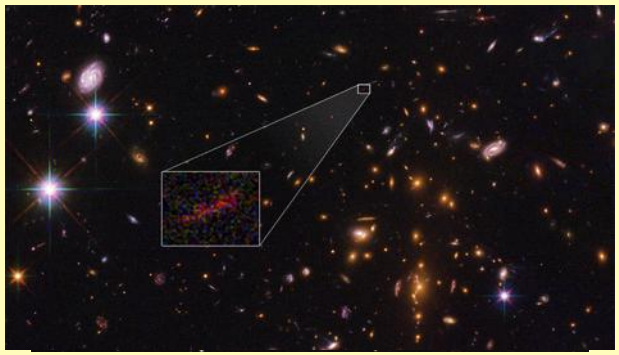


• ***BB prediction***: ***H*** *to* ***He*** *ratio of 3-to-1* by mass

• ***observation***: galaxies are 25%* ***He*** by mass

Early Galaxies

• early galaxies have a *distorted* appearance



• ***HST*** images looking back ***13+ Gy***

Review: Big Bang

• *expansion of spacetime* ***between*** galaxies carries them away from each other; began with ***Big Bang***

• "***cosmological redshift***" - light is stretched, too

• understanding *history of universe* involves understanding *forces*, *particles*, & *energy*

• ***significant experimental evidence*** supports ***BBT***
